

CAP776: PROGRAMMING IN PYTHON

MINOR PROJECT #1 REPORT

MY DATA, MY STORY

Personal Activity Intelligence Report

Student Details	Info
Student Name	Aman Sharma
Registration / Roll No.	12608986
Program / Section	MCA-D1P2631
Activity Recording Period	20 July 2026 to 25 September 2026
Date of Report Generation	29 September 2026

1. Activity Data Summary

Particular	Value
Expected number of days	68
Valid days recorded	68
Missing days	0
Invalid / excluded records	0
Average Sleep/day	436.8 min/day
Average Fitness/day	20.1 min/day
Average Study/day	98.6 min/day
Average Coding/day	48.4 min/day
Average Class/day	182.8 min/day
Average Other Activities/day	37.4 min/day
Average Free / Unaccounted Time/day	616.0 min/day

2. Index Values

Enter the final value generated by your Python program. The activity indicators are based on simple averages across valid recorded days. PAI is calculated using the predefined weights shown below.

Index Name	Acronym	Formula	Value to Enter
Personal Activity Index	PAI	PAI = $0.15(\text{TPI}) + 0.20(\text{AAI}) + 0.15(\text{PhAI}) + 0.20(\text{SRI}) + 0.15(\text{TUI}) + 0.10(\text{EI}) + 0.05(\text{DCI})$	282.9
Tech Productivity	TPI	TPI = Average(Coding Time per valid recorded day)	48.4 min/day
Academic Activity	AAI	AAI = Average(Study Time + Class Time per valid recorded day)	281.4 min/day
Physical Activity	PhAI	PhAI = Average(Fitness Time per valid recorded day)	20.1 min/day
Sleep & Recovery	SRI	SRI = Average(Sleep Time per valid recorded day)	436.8 min/day
Activity Balance	ABI	ABI = Average(Free / Unaccounted Time per valid recorded day)	616.0 min/day
Time Utilization	TUI	TUI = Average(Total Tracked Time per valid recorded day)	824.0 min/day
Experience Index	EI	EI = Average of daily (Feeling Score + Satisfaction Score + Energy Score) / 3	3.33 / 5
Data Continuity Index	DCI	DCI = (Valid Recorded Days / Expected Days) × 100	100.0 %

Formula references: All time values are taken directly from the activity record and averaged across valid recorded days. Feeling, Satisfaction and Energy are scored using the prescribed 5/4/3/2/1, 5/4/3/2/1 and 3/2/1 scales respectively. PAI uses the predefined weights shown above. DCI rewards complete and continuous recording from 20 July 2026.

3. Key Findings from My Data

No.	Correlation/Observation	Evidence from my data
1	Sleep ↔ Energy	Not calculable: energy was recorded as Medium on all 68 days, so there is no variation to correlate.
2	Study ↔ Satisfaction	Not calculable: satisfaction was recorded as Satisfied on all 68 days, so there is no variation to correlate.
3	Coding ↔ Energy	Not calculable: energy was recorded as Medium on all 68 days, so there is no variation to correlate.
4	Sleep ↔ Study	Days with more sleep tended to have more study time ($r = 0.44$), a moderate positive link.
5	Class ↔ Free / Unaccounted Time	Days with more class time had much less free time ($r = -0.82$), a strong negative link.

4. Findings About Myself (100–200 words)

Write about what your activity data revealed about your habits, priorities, consistency, balance, academic/technical engagement, and the relationship between activities and your reported experience.

Over 68 consecutive days, from 20 July 2026 to 25 September 2026, I logged every day without a gap, so my recording was fully continuous (DCI 100%). Sleep was my steadiest habit: every night fell between 7 and 8 hours, averaging 7.3 hours (436.8 minutes). Academics took the largest share of my active time, with study plus class averaging 281.4 minutes a day, and class hours fell almost entirely on weekdays. Coding averaged 48.4 minutes and fitness only 20.1 minutes; I logged no fitness at all on 33 of the 68 days. Weekends looked different: coding rose to about 69 minutes and study to about 138 minutes, and free time reached about 709 minutes against 582 on weekdays. My mood columns never changed (Good, Satisfied, Medium every day), so I could not test how activities affect my feelings.

5. Areas and Ways to Improve My Lifestyle (100–200 words)

Identify the areas you would like to improve and describe specific, realistic ways in which you intend to improve them based on the evidence from your data.

Fitness is the clearest gap: at 20.1 minutes a day, with no workout on 33 of 68 days, I will schedule a fixed 30-minute session on at least five days a week, using the gaps between weekday classes. Coding averaged 41 minutes on weekdays against 69 on weekends, so I will add a protected 60-minute weekday coding slot to even this out. About 616 minutes a day remain unaccounted for while “Other Activities” averages only 37 minutes, so I will log what I do in that time more specifically. I will also choose my real feeling, satisfaction and energy each evening instead of repeating the same option, so that future reports can show genuine correlations. Finally, since my sleep stays between 7 and 8 hours and moves together with study time ($r = 0.44$), I will keep protecting it.

6. Student Declaration

I confirm that the values entered in this report have been generated from my submitted activity data using my Python program and that the report represents my own analysis.
